Why Use DES with Microsoft SharePoint®?

What can you do with DES?

- Use the SharePoint Term Store for Content outside of SharePoint.
- Connect to multiple Data Sources simultaneously.
- Monitors predefined locations in each Data Source and process new and changed content.
- Process Batch or Transactional data feeds with automated Data Source updates.
- Add support for additional Data Sources as needed.
- Leverage your investment in automatic metadata generation technologies by applying these technologies across multiple Data Sources using one standard interface for all technologies.
- Automatically enforce and apply corporate metadata standards throughout the organization.
- Monitor Data Enhancement Performance Metrics.
- Monitor content that is NOT being enhanced as expected.

What is the value DES brings?

DES' value is in its ability to:

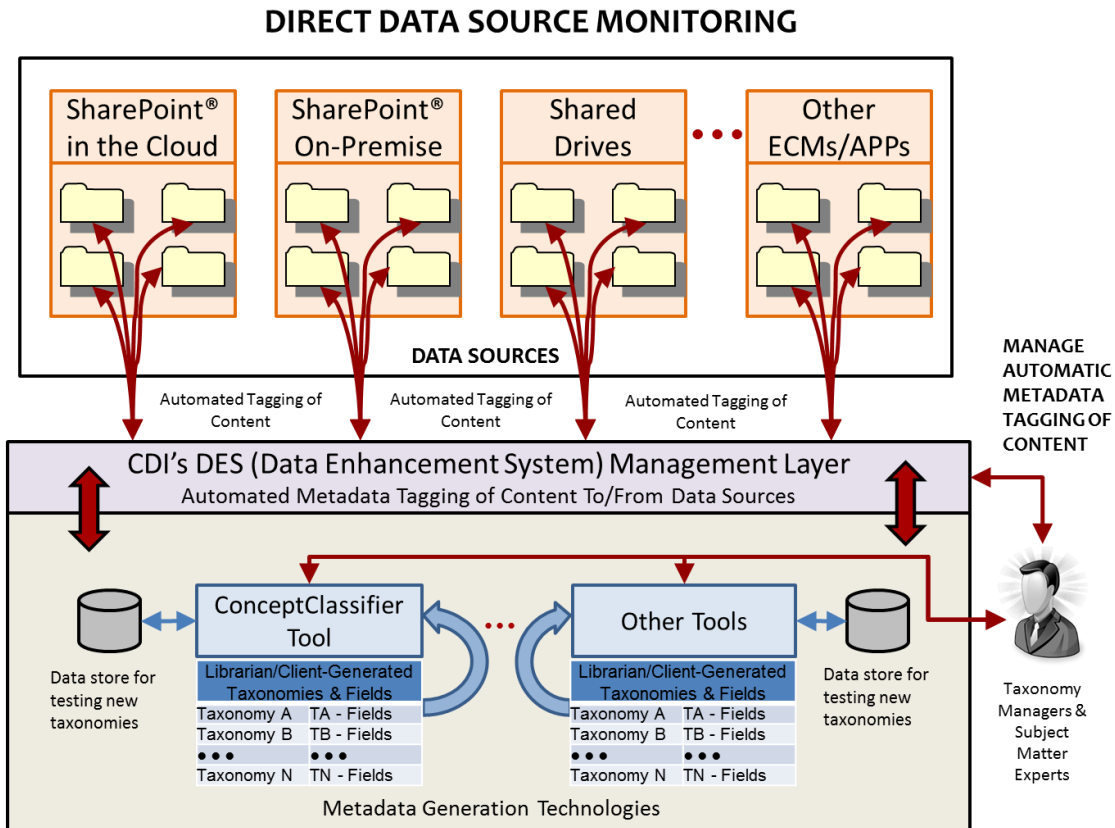

- Centralize control for the augmentation of content at Corporate and Departmental levels.
- Separate the automatic metadata generation technology from the management of the augmentation process and rules.
- Reduce the cost involved in the integration of an automatic metadata generation technology with each Data Source or Data Generation Source. Imagine if you had more than one automatic metadata generation technology that you want to use.
- Use multiple automatic metadata generation technologies to enhance content using a single control point.
- Automatically apply Record Retention Schedule tags to any content regardless of its location.
- Support multiple Data Sources and Data Generation Sources.

Direct Data Source Monitoring

©2012 COMPU-DATA International, LLC, All Rights Reserved

What does DES do for Data Sources?

DES manages the augmentation process of the electronic content found in the locations of Data Sources being monitored. DES monitors each location simultaneously processing the content using the metadata generation technologies configured. In one single pass of the content through the DES process, DES will update the content's property at the Data Source with the metadata generated by each of the technologies assigned.

Integration with Data Generation Sources

INTEGRATION WITH CAPTURE, PROCESSES & APPLICATIONS

What does DES do for Capture, Automated Processes & Applications?

DES manages the augmentation process of the electronic content delivered by any Data Generation Source. DES monitors its input queues simultaneously processing the content received using the metadata generation technologies configured. In one single pass through the DES process and subject to the transaction received, DES will (a) update the Data Source with the content received and with the metadata generated by each of the technologies assigned or (b) return the metadata generated by each of the technologies assigned to the Data Generation Source.
